

Case History #RM610 Emergency Response Planning

Baker Engineering and Risk Consultants, Inc.

BENEFIT

Clearly identifying potential exposures and developing cost-effective responses resulted in savings of \$30K annually

BakerRisk assisted a large petroleum production facility in developing an emergency response plan coupled with additional response actions, alarms, and equipment that allowed remote on-site personnel to safely control the emergency, protect personnel involved, and minimize equipment damage until on-call and external responders were on-site.

By clearly identifying the potential exposures and developing appropriate responses, BakerRisk saved the client \$30,000 per year by eliminating the need for additional facility staffing, additional training, and maintenance of unnecessary equipment as a result of having to react to unrealistic scenarios and associated responses.
